

Course Introduction

Welcome to PHYS 41: General Physical Science

This physical science course is a high school level introductory course, and I have tried to focus on important concepts. Physical science is pretty broad, including both chemistry and physics. Among the topics you will learn about in this course will be motion, forces, energy, matter, chemical reactions, electricity, and waves. As we go into greater detail to understand physical science, take the time to observe the world around where you live.

Watch for examples of what you learn on local television news broadcasts, in the newspaper, or online. You will be amazed at how much you will learn and understand about the world around you!

PHYS 41 is an introductory physical science course. You will be expected to be able to perform basic algebra throughout the course.

Read the lessons thoroughly and study the question examples in each lesson. The examples will especially be a great help with the algebra. Other than that, all you need is a willingness to learn about the physical world all around you! With a little hard work and determination you will do just fine!
